

Welcome to SIRGAS-CON Plugin

Thank you for installing the SIRGAS-CON plugin for QGIS!

This plugin, developed by Filipe José Americano Albeny and Luis Philippe Ventura Rodrigues, was created to assist users in downloading and visualizing GNSS station data from the SIRGAS-CON network directly within the QGIS environment.

Main functionalities:

- Select a time period to filter GNSS stations based on their activity range.
- Download and extract station coordinate and velocity data from the official SIRGAS archive.
- Optionally clip stations using a polygon shapefile.
- Export results as CSV and shapefile formats.

Make sure to set a valid destination folder and provide valid dates. For additional support or information, please contact the author via email:

albeny.filipe@ime.eb.br or ventura.luis@ime.eb.br
